

GREENHOUSE GAS

Greenhouse gas refers to the gas compounds which are present in the atmosphere and have the ability to retain heat. Greenhouse gases are mainly produced by the use of fossil fuels.

At ERNA-MAŞ facilities we supply electrical energy and natural gas to the production phases. Company data is input to the CDP Climate Change Program to record and monitor the greenhouse gas emissions in our facilities. The data collected within the scope of the CDP Climate Change Program are evaluated using the special ranking methodology and used for preparing the CDP Reports every year.
